

Family Paws Dog Daycare & Boarding Website

Website Development Project Proposal

Tanya Artz | CA 1040 Website Development

1. Project Title

Family Paws Dog Daycare & Boarding Website

2. Project Overview

For my semester project, I will design and develop a front-end website for a fictional dog daycare and boarding business called Family Paws. The purpose of the website is to provide potential customers with clear information about the business, available services, pricing, photos, and contact options.

The website will be designed for pet owners who want safe, reliable, and friendly care for their dogs. Key features will include multiple webpages, a responsive layout, service information, a pricing table, a photo gallery, an FAQ section, and a contact form. The website will be built using HTML, CSS, and JavaScript.

I chose this project because it is realistic, useful, and achievable within the remaining class timeline. Many pet owners look online before choosing a daycare or boarding provider, so this website will show how a small business can use a simple front-end website to build trust and provide helpful information.

3. Target Audience

The target audience for this website is dog owners between the ages of 25 and 60 who need daycare, boarding, or grooming services. This may include working professionals, families, and frequent travelers.

The website will appeal to this audience by using a warm and welcoming design, simple navigation, clear service descriptions, pet-related images, and an easy-to-use contact form. The design will focus on helping users quickly find the information they need.

4. Core Features

The website will include the following front-end features:

- A home page introducing the business
- A services page with descriptions and pricing
- A gallery page with a JavaScript image slideshow
- A contact page with a basic form
- Responsive design for desktop and mobile devices
- A navigation menu on each page
- An expandable FAQ section using JavaScript
- Hover effects for buttons and navigation links
- Alt text for images to support accessibility

These features are achievable using HTML, CSS, and beginner-level JavaScript.

5. Design and User Experience

The website will use a clean, friendly, and professional design. The color palette will include warm neutral colors to create a welcoming feeling. Pages will be organized with clear headings, consistent navigation, and easy-to-read text.

To improve user experience, the website will include simple page layouts, mobile-friendly design, readable fonts, clear buttons, and organized sections. Accessibility will be considered by using proper heading structure, descriptive link text, and alt text for images.

6. Wireframes and Mockups

Basic wireframes will be used to guide the layout of each page:

Page	Planned Layout
Home	Header + navigation; hero section with welcome message and button; three service cards (Daycare, Boarding, Grooming); “why choose us” list; footer.
Services	Header + navigation; services table (Service / Description / Starting Price); FAQ section with clickable questions; footer.
Gallery	Header + navigation; image slideshow with Previous/Next buttons; footer.
Contact	Header + navigation; contact form collecting Name, Email, Service Interest, and Message; footer.

7. Project Timeline

Week	Dates	Focus
Week 1	June 27 – July 3	Finalize proposal and wireframes; gather images and written content; build basic HTML structure for all pages; create navigation links between pages.
Week 2	July 4 – July 10	Add CSS styling; create the color palette, fonts, spacing, and layout; add images and page content; begin responsive design adjustments.
Week 3	July 11 – July 17	Add JavaScript features; create the image slideshow; add the expandable FAQ section; add simple contact form interaction.
Week 4	July 18 – July 24	Test all pages and links; check mobile responsiveness; fix formatting issues; review accessibility items; complete final edits and submit.

8. Challenges and Risks

Potential challenges include managing time, learning responsive design, and making sure the JavaScript features work correctly. Since the project timeline is only four weeks, it will be important to keep the website focused and avoid features that require backend programming.

To manage these risks, I will build one section at a time, test the website frequently, and keep the JavaScript features simple and realistic. I will avoid advanced features like online booking, user accounts, or payment processing because those are outside the scope of this front-end project.

9. Collaboration

This project will be completed individually.

10. Conclusion

By the end of the semester, I hope to create a complete, functional, and visually appealing front-end website for Family Paws. The project will demonstrate my ability to use HTML, CSS, and JavaScript while creating a realistic website for a specific audience.
